09 The Solution: Assessment Workflow

10 How to Use

11 Migration Targets

12 Live Scan Results — Enterprise

13 Live Scan Results — Personal

14 Get Started

The ACS Transition Agent is an AI-powered assessment tool that connects directly to customer Azure subscriptions to automatically discover, analyze, and report on retiring Azure Communication Services resources — empowering customers and partners to migrate seamlessly before the **March 31, 2029** retirement deadline.

Discover

Automatically find all ACS resources across one or more Azure subscriptions

Analyze

Measure actual channel usage via Azure Monitor metrics over a 90-day lookback

Match

Map detected usage to retiring features and applicable migration paths

Guide

Generate actionable reports (CSV, Markdown, JSON) with per-channel migration links

Scale

Designed as a model for future Azure retirement scenarios — reusable and extensible

Who is this tool designed for?

Technical Lead / Developer

Runs the scan directly using Claude Code or GitHub Copilot

Reviews which ACS resources and channels are in use

Uses exported reports to plan and execute migration

Integrates skill-based workflow into existing DevOps processes

Can run assessments across multiple subscriptions

Business Decision Maker (BDM)

Reviews the Markdown and CSV impact reports

Understands migration urgency and business risk

Uses findings to allocate migration resources and timelines

Gets a clear picture of which services are affected

Informed without needing to run the technical scan

The goal is to have a product that can be a **model for other Azure retirements**. It provides customers with information on what is changing and how it impacts them, and empowers the developer customer to migrate seamlessly by providing the BDM/TDM with actionable intelligence.

1

Reducing Support Burden

Proactive, automated assessment reduces inbound support tickets from customers who are unaware of how the retirement affects them. Customers arrive informed rather than reactive.

2

Solution for Customer Migration

Provides a structured, repeatable path for customers to migrate their ACS services — with per-channel migration guides, usage data, and exportable reports ready to share with engineering teams.

3

Integration with Existing Services

Built on open Agent Skills standard (Linux Foundation / AAIF). Compatible with GitHub Copilot, Claude Code, Cursor, and Windsurf — integrates into existing developer workflows with zero new tooling.

4

Reusable Model for Future Retirements

The skill-based architecture is generic. The same pattern can be applied to any future Azure service retirement — reducing time-to-delivery for the next deprecation assessment tool.

Azure Communication Services (ACS) is evolving from standalone SDKs and APIs toward integrated scenarios with Microsoft Teams. While this unlocks powerful new capabilities, it creates a complex migration challenge for customers, partners, and Microsoft teams alike.

The Challenge

- ! Customers using ACS standalone features need to understand if and how the deprecation affects them
- ! Many customers don't know which specific features they're using or how heavily they rely on them
- ! Migration guidance exists but customers must manually assess their eligibility and relevance
- ! Partners supporting customers need a systematic way to evaluate migration scope across portfolios
- ! Microsoft support and engineering teams need visibility into customer impact for prioritization

The Opportunity

- * An intelligent, automated eligibility checker transforms the deprecation experience from reactive and uncertain to proactive and clear
- * Benefits every stakeholder in the ecosystem — customers, partners, and Microsoft teams
- * Reduces time-to-clarity from weeks of manual assessment to minutes of automated scanning

The ACS AI Transition Agent is a web-based tool that connects directly to customer Azure subscriptions to automatically assess deprecation impact and guide migration.

1	Discover	Find all Azure Communication Services resources across subscriptions
2	Analyze	Analyze actual usage patterns through Azure Monitor metrics and SDK telemetry
3	Match	Match detected usage against the catalog of retiring features
4	Guide	Guide customers to appropriate migration paths and integrated scenarios

Output Formats

CSV	Markdown	JSON
Excel-compatible, 17-column impact report. One row per ACS resource.	Human-readable report with migration guide links per channel.	Machine-readable output for integration with existing tooling.

Microsoft is retiring Azure Communication Services

5 channels are being retired or changed effective **March 31, 2029**.

Organizations using ACS must identify which services they use and migrate before the deadline — or face service disruption.

Channels Affected

Email Service	Retirement
SMS API	Retirement
Chat SDK	Retirement
Calling SDK	Breaking Change
Phone Numbers SDK	Retirement

Retirement date: March 31, 2029 | Source: aka.ms/acs-retirement-and-breaking-changes-guide

ACS Transition Agent automates the entire assessment workflow using AI agent skills and Azure CLI. No PowerShell required.

1

Authenticate

az login — verify Azure session

2

Select Subscription

Choose one or all subscriptions to scan

3

Discover Resources

Find all ACS CommunicationServices resources

4

Detect Channels

Fast (Email/Phone) or Full (all 5 via Azure Monitor)

5

Analyze Impact

Map channels to migration guides and retirement dates

6

Generate Reports

CSV + Markdown + JSON exported to ./exports/

Prerequisites

- Git
- Azure CLI (learn.microsoft.com/cli/azure)
- GitHub Copilot or Claude Code
- Reader + Monitoring Reader on target subscription(s)

Run the Scan

1. Clone the repository
2. Open in VS Code with GitHub Copilot or Claude Code
3. Type in chat: **"Run an ACS deprecation scan"**
4. Follow the interactive prompts
5. Reports saved to `./exports/`

Channel	Recommended Migration Path	Guide
Email Service	Microsoft 365 High-Volume Email (HVE)	aka.ms/acs-email-migration
SMS API	Port numbers to a third-party SMS provider	aka.ms/acs-sms-migration
Chat SDK	Microsoft Teams Chat via Microsoft Graph APIs	aka.ms/acs-chat-migration
Calling SDK	Microsoft Teams (Phone Extensibility, Meeting Interop, Click-2-Call)	aka.ms/acs-calling-migration
Phone Numbers SDK	Port to Teams Phone Extensibility or third-party provider	aka.ms/acs-phone-migration

Full guide: aka.ms/acs-retirement-and-breaking-changes-guide

Subscription: **Azure Communication Services** (50ad1522-5c2c-4d9a-a6c8-67c11ecb75b8)
Scan Date: **2026-03-04** | Detection Mode: **Fast (Email + Phone Numbers via child resources)**

Channel Detection Summary

Channel	Status	Resources Impacted	Retirement Date	Action Required
Email Service	Detected	183	2029-03-31	Migrate to M365 HVE
Phone Numbers SDK	Not detected	0	2029-03-31	No action required
SMS API	Not scanned	—	2029-03-31	Re-run with Full scan
Chat SDK	Not scanned	—	2029-03-31	Re-run with Full scan
Calling SDK	Not scanned	—	2029-03-31	Re-run with Full scan

Reports exported to ./exports/ | acs-impact-20260304-164754.csv | .json | .md
Next step: Re-run with Full scan (mode 2) to detect SMS, Chat, and Calling usage via Azure Monitor.

Account: **jameelahr2002@gmail.com**
Scan Date: **2026-03-09** | Detection Mode: **Full (all 5 channels via Azure Monitor, 90-day lookback)**

Subscriptions Scanned: 2

Subscription	ID	Resources	Status
Visual Studio Enterprise Subscription	a024334f-849a-4470-9d81-d28e2c5a8386	0 ACS resources	No action required
JameelaPayAsYouGo	a89e7234-d3e0-4956-ae2-934220095a4e	2 ACS resources	Provisioned, zero usage — retirement planning required

Channel Detection — JameelaPayAsYouGo

Resource	Email	SMS	Chat	Calling	Phone Numbers	Channels Active
ACSPProd	0 requests	0 requests	0 requests	0 requests	0 requests	0 / 5
ACSDevAndTest	0 requests	0 requests	0 requests	0 requests	0 requests	0 / 5

Both resources are provisioned but have had zero API activity in the past 90 days.
Recommendation: Decommission unused resources, or plan migration before 2029-03-31.
